

I hand off my Claude sessions several times a day.

Two small skills reset the context window and keep the goal.

Two skills, 35 lines of Markdown.

Put them in `~/.claude/skills/` and they work in any folder, git repo or not.

Already run a bigger workflow? Keep it. These are a small default.

CLAUDE.md holds what lasts. A handoff holds the rest: work that runs past one session but is too **temporary to keep.**

/handoff writes one note, five parts

01 Goal: what we're working toward

02 Done: what's finished, with paths

03 Next: the open steps, in order

04 Decisions: each choice and why

05 Suggested skills: what to load

Goal

Draft the handoff-and-pickup piece.

Done

Interview saved to interview.md.

Next

Run draft-piece on the folder.

Decisions

Main message: "simple on purpose".

Suggested skills

draft-piece

/pickup picks it back up

- 01 Read the note
 - 02 Check the files it names and recent commits
 - 03 Load the suggested skills
 - 04 Report back, then wait for a go-ahead
-

Goal: draft the post on /handoff
and /pickup.

First step: run draft-piece.

Drift: the idea note moved out of
ideas/ into the piece folder.

Then it waited for my go-ahead.

**I hand off after every sub-task,
by the time the context window
is about a quarter **full**.**

It's like one big continuous session, without the
context rot.

When do you start a fresh session?

At a token count, a task boundary, or when it starts to drift?

Both skills: github.com/seanmishra/claude-skills
