

I build software to learn. Lately, mostly with AI.

What I'll be sharing here each week, and why I started.

I've been writing software for over ten years. The part I still love most is the moment something new finally **clicks**.

One weekend of building teaches me more than a month of reading.

So I make small things on purpose: a desktop markdown editor, automations for my notes, throwaway prototypes.

AI made building **fun** again.

It handles the boilerplate and leaves me the interesting problems.

Ideas I used to shelve for "someday" now get a working prototype in an evening.

The skill that matters most now is **judgment**. Knowing what to build, what to ask for, and when the output is wrong.

Five things I'll keep coming back to

-
- 01 AI workflows and prompts
 - 02 Small builds made to learn something
 - 03 Dev craft worth stealing
 - 04 Lessons from ten years of shipping
 - 05 Focus and energy for building
-

One idea a week, messy parts included.

Real prompts, real code, and an honest account of what worked.

Written for people who build things to learn how they work.

What are you building with AI right now?

Tell me in the comments. I'd like to know.

Follow along for one idea every week.
